

How to brew coffee in your

JAVAJAVA coffeemaker

Parts of the JAVAJAVA coffeemaker

To brew a pot of coffee you'll need

Ground Coffee
Coffee Filters
6-8 cups Water
Measuring Spoon
your

JAVAJAVA
coffeemaker

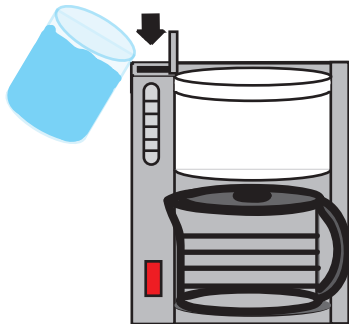

Caution: Risk of Electric Shock!
to reduce risk of electric shock,
do not remove plastic casing.
Use electrical outlets only
when plug is dry.

Before brewing, make sure your **JAVAJAVA** coffeemaker is properly assembled & plugged in to a standard wall outlet.

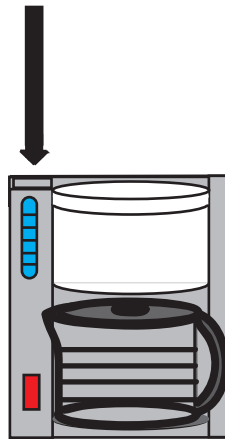

1. Measure out a little over a cup of water for every cup of coffee you want to brew.

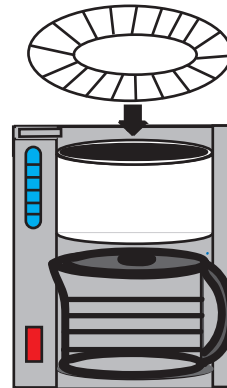

2. Open the water reservoir lid and carefully add water to the reservoir.

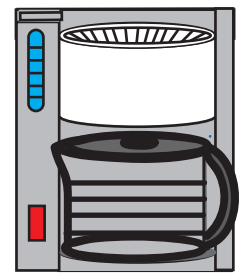

3. Close the reservoir lid.

4. Remove the basket lid and place a clean coffee filter in the basket.

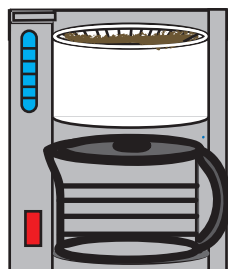

5. Gently press the coffee filter against all edges of the basket, covering as much of the basket as possible.

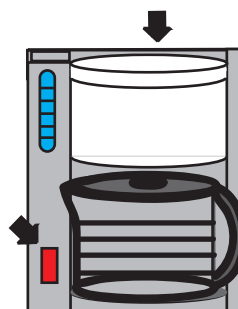

6. Scoop out one tablespoon of ground coffee for every cup of coffee you want to make, unless your brand of coffee says differently.

7. Put each tablespoon of ground coffee into the filtered basket.

8. Replace the basket lid and press the power button.

9. Your coffee is ready when it has all dripped through the spout to the carafe.

The heating plate under the coffee pot will keep your coffee warm, but if you leave it too long it will become bitter. Serve and Enjoy!
